Speech Sounds and Features (Current Studies in Linguistics)

This is a representative collection of the work of one of the worldsleading scholars in the area of speech acoustics. It follows the development overthe past 15 years of research presented in the authors previous publications onspeech analysis, feature theory, and applications to language descriptions. Most ofthe articles have had very restricted distribution -- many appearing only in theQuarterly Progress Reports issued by Dr. Fants laboratory.The first part of thebook covers manifold aspects of speech analysis such as instrumental techniques, spectrum data, formant statistics with an emphasis on Swedish vowels and stops, speaker dependencies, normalization procedures, production theory, andcoarticulation. The second part analyzes established feature systems and suggestsrevisions and general discussions on the concept of distinctive features, perception, and the applicability of feature theory to automatic speech recognition.Articles in this part of the book are especially valuable because they represent Dr.Fants work on inherent features and their phonetic correlates as it has evolvedsince his collaboration in 1952 with Roman Jakobson and Morris Halle.Speech Soundsand Features is the fourth volume in the series Current Studies inLinguistics.
